A public space design along the Warta River

Landscape II BA Semester Project

This semester's project focuses on the area between several bridges on the Warta River. Our goal is to analyze the surroundings to develop the best renovation plan and create a vibrant space for community activities.

This work was completed with the kind guidance of Dr. Eng. Izabela Myszkia.

located along the Warta River

Our project begins with the Warta River as its foundation. Through a comprehensive analysis of the site's natural environment, transportation network, and cultural context, we developed a SWOT matrix and formulated a design strategy. The circulation and functional layout were redefined to address existing urban issues.

Inspired by the works of Salvador Dalí, we extracted key concepts such as time, flow, and curves to express a spatial experience of movement, temporality, renewal, and eternity.

The Most Mieszka I Bridge in Poznań, Poland, spans the Warta River, connecting the city's east and west banks. Named after Poland's first ruler, it is a key transport hub with motor, bike, and pedestrian lanes. The bridge links residential areas, the business district near Stary Rynek, and educational institutions, while also offering access to scenic river landscapes and floodplain ecology.

The Saint Roch Bridge in central Poznan connects key areas across the Warta River:
Residential: Wilda District to the south offers mixed residential and commercial spaces.
Business: Stary Rynek (historical hub) and Swi ty Marcin Street (major commercial street) lie nearby.
Education: Adam Mickiewicz University (city center) and Poznan University of Technology (east bank) are close to the bridge.

The Queen Jadwiga Bridge in Poznań spans the Warta River, connecting dense residential areas, commercial zones, and educational institutions. It serves as a key traffic hub and symbolizes Poland's shift from communist to medieval heritage through its renaming.

The Przemysław I Bridge near the Warta River features extensive green spaces for recreation but limited development. It connects low-density residential areas with minimal commercial and educational facilities, serving mainly as a transportation route for vehicles, cyclists, and pedestrians.

SWOT Analysis

Strengths

- Excellent natural landscape and ecological quality
- Prime location with convenient transportation
- Rich cultural and historical heritage

Opportunities

- High potential for waterfront commercial and tourism development
- Strong ecological foundation for sustainable growth
- Smart city and modernization initiatives

Weaknesses

- Underused cultural assets and outdated infrastructure
- Lack of commercial development and iconic landmarks
- Disorganized spatial design and poor pedestrian/cyclist separation

Threats

- Pollution, climate change, water shifts
- Low competitiveness in Europe
- Policy and land challenges

Design guide line

Strengths → Design Principles
Enhance Ecology: Preserve ecosystems and create eco-friendly trails.
Cultural Value: Introduce interactive exhibitions and artistic zones.
Better Access: Clarify paths and improve public transport links.

Weaknesses → Improvement Strategies
Update Infrastructure: Add modern, accessible, and smart facilities.
Boost Commerce: Add cafés, events, and markets near the water.
Refine Layout: Create defined zones and iconic landmarks.

Opportunities → Development Strategies
Sustainability: Use rain gardens, eco-materials, and smart sensors.
Culture + Tourism: Combine ecology with digital information systems.
Modernization: Use smart lighting and self-cleaning tech.

Threats → Prevention Measures
Environmental Action: Use recycling and water-purification systems.
Climate Adaptation: Design for floods and drought resistance.
Stay Competitive: Learn from top parks and encourage partnerships.

Urban Structure & Population Dynamics

The west bank of the Warta River concentrates Poznań's economic, commercial, and historical core, with dense residential areas and strong transport links. The east bank is less developed, mainly residential, and holds potential for future growth.

Residential zones vary in character:

- Education areas host younger and more diverse populations, including international students.
- Traditional neighborhoods like Wilda and Rataje are home to local citizens.

Ostrów Tumski, a historic religious center, has a unique population structure dominated by clergy, scholars, and cultural professionals, with a floating population of tourists, pilgrims, and researchers drawn to its churches and academic institutions.
